

Appendix 1 Stream Assessments

This will be a 4-step process:

- 1) Desktop analysis – any provincial data that is available, Babine Forest Products data and Chinooks site plans for identifying fish streams. This should help narrow down the scope of work.
- 2) Identify known fish barriers and apply for required permits.
- 3) We will need to try and schedule one meeting per nation, 6 First Nations within the Chinook tenure.
- 4) Electrofishing of streams to determine fish bearing.
- 5) Through all stages of this project note and identify any other issues with streams.
Eg: Streams/riparian areas blow down mess causing a fire risk, bank sloughing, road sediment finding its way to streams etc etc
- 6) Final Reporting and a RpBio to sign off on any potential down grading of streams.
